

# Ro-ber Industrieroboter GmbH

## Systematic automation

Main field of activity of RO-BER, founded in Berlin in 1983, is the automation in material handling and goods distribution.

The application of gantry and articulated robots offers numerous solutions for complex task definitions in the field of palletizing, depalletizing and order picking.

Extensive projecting experience which is reflected in renowned references in almost any branch of business makes ro-ber a partner of competence for your automation requirements. By using reliable gripping concepts and integrating individually adjusted software great potentials of performance and efficiency and high process stability can be realized

Main focus of our continous development work is to make operation of the systems more user-friendly and to increase service dependability and safety. Part of these efforts is the integration of an error- and status-documentation-system and remote control system.
